## Projects

### KNOW Job Portal

Backend Developer

**Technology Stack:** PHP, MySQL, HTML5, CSS3, Bootstrap, JavaScript, jQuery

KNOW is a job portal, with a role-based application. 3 types of members are their admin, employer, and employee. Employers will add their company info, job vacancies...

Employees can watch that job vacancy & apply for that post.

Responsibility:

- Database design, one-to-many, many-to-many relationships.
- Used CodeIgniter form-type classes to create user input screens
- Set up command line functionality using CodeIgniter Command classes.

- Used the jQuery Data Tables plugin to display data brought back from the database.
- Used HTTP for authentication.
- Used Jira for tickets, and workflow.

Modules:

Forum module with 'Popular & Trends' features

Profile Builder module with personal info, Skill sets, Known languages, and social media links.

## Maamisa Mall – Offline

**Project Description:** Maamisa mall is an online E-commerce product for selling non-veg foods, mainly mutton & chicken using their delivery boys. The objective is for customers can able to register, search for products, order products & track their orders. There were 4 types of roles available in this product.

- Admin
- Receptionist
- Customer
- Delivery Boy

Admin will handle site settings, and role permissions, create product categories, and products & generate reports. The receptionist can handle the order(s) over the phone & he/she assigned the order to a specific delivery boy.

Delivery boy will receive notifications about his deliveries when he is assigned to a specific order. He will collect the ordered products & deliver them to the customers.

Once a customer receives the goods & acknowledges them in the order record, then the delivery boy can close that order. Stripe, PayPal & Cash on delivery are used in this application

Major Scope:

- Role-based accessibility integration
- Store management in both front & admin portals
- Performance Tuning in various aspects

Responsibilities:

- Implemented proper class/hierarchy design with abstract classes/functions, and interfaces.
- Made variable/function scope definition decisions (i.e., private/public/protected).
- Wrote functions, calling them via AJAX. Query optimization - breaking down slow-running queries into smaller queries and joining them.
- Created JavaScript charts with data brought back from AJAX calls.
- Implemented user customization with jQuery drag-and-drop functionality.

**The technology used:** MySQL, Bootstrap, JavaScript, jQuery, Payment Gateway integration, Responsive Design, Ajax, HTML5, CSS.

## Daily books

Backend Developer

This is a business website for invoice and expense tracking. I worked on defects.
